Novel antibody that specifically binds to for testing an allergen reactivity of IgE or treating asthma or anaphylactic shock. mammalian IgE epitope, useful sample, detecting mammalian I IgE

Example 6; Page 9; 14pp; English.

The present invention relates to a novel monoclonal antibody (I) that specifically binds to a mammalian IGE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IGE, e.g. dog IGE. (I) is useful for testing an allergen reactivity of an IGE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (I) is also useful for detecting mammalian IGE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal antibodies recognise epitopes on canine IGE corresponding to amino acid residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the

Recognition of epsilon-chains from IgE from cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and 3.76 were observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE. The present sequence is the cat IgE 3.76 recognition site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian Igor treating asthma or anaphylactic shock.
